A Bridge Day

Time limit: 2s

Description

The country of CAT adopts a calendar with $\boldsymbol{N}$ months in each year numbered 1 to $\boldsymbol{N}$. Month i contains $\boldsymbol{B}_i$ days numbered 1 to $\boldsymbol{B}_i$. Day j month i $(1 \le j < \boldsymbol{B}_i)$ is followed by day $j+1$ month i. Day $\boldsymbol{B}_i$ month i $(1 \le i < \boldsymbol{N})$ is followed by day 1 month $i+1$.

This year, there are $\boldsymbol{L}$ CAT national holidays. National holiday k falls on day $\boldsymbol{D}_k$ month $\boldsymbol{M}_k$.

For each $1 \le k < \boldsymbol{L}$, national holiday k falls before national holiday $k+1$. In other words, either

- $\boldsymbol{M}_k < \boldsymbol{M}_{k+1}$ or
- $\boldsymbol{M}_k = \boldsymbol{M}_{k+1}$ and $\boldsymbol{D}_k < \boldsymbol{D}_{k+1}$

A day that is **not** a holiday is defined as a *bridge day* if the day before and the day after are holidays. In this problem, we assume there is no holiday in the year before (the days before day 1 month 1) and the year after (the days after day $\boldsymbol{B}_{\boldsymbol{N}}$ month $\boldsymbol{N}$). Therefore, the first day and the last day in this year are **not** bridge days. We also assume there is no holiday other than the given $\boldsymbol{L}$ national holidays.

For example, assume $\boldsymbol{N} = 3$, $\boldsymbol{B}_1 = 31$, $\boldsymbol{B}_2 = 28$, $\boldsymbol{B}_3 = 31$, $\boldsymbol{L} = 7$, and the holidays fall on

- day 1 month 1, day 3 month 1, day 28 month 1, day 29 month 1, day 30 month 1,
- day 1 month 2, and
- day 30 month 3.

Therefore:

- Day 2 month 1 is a bridge day, since day 1 month 1 and day 3 month 1 are holidays, and day 2 month 1 is **not** a holiday.
- Day 31 month 1 is a bridge day, since day 30 month 1 and day 1 month 2 are holidays, and day 31 month 1 is **not** a holiday.
- Day 4 month 1 is **not** a bridge day, since day 5 month 1 **not** a holiday.
- Day 29 month 1 is **not** a bridge day, since day 29 month 1 is a holiday.
- Day 31 month 3 is **not** a bridge day, since the day after is not in this year.

You want to find out whether there is a bridge day this year.

Input

The first line contains two integers $\boldsymbol{N}$ and $\boldsymbol{L}$ ($1 \le \boldsymbol{N} \le 12; 1 \le \boldsymbol{L} \le 365$) separated by a space. The second line contains $\boldsymbol{N}$ integers $\boldsymbol{B}_1, \boldsymbol{B}_2, \ldots, \boldsymbol{B}_{\boldsymbol{N}}$ ($28 \le \boldsymbol{B}_i \le 31; \sum_{i=1}^{\boldsymbol{N}} \boldsymbol{B}_i \ge \boldsymbol{L}$). The next $\boldsymbol{L}$ lines each contain two integers separated by a space. The $k+2$-th line contains integers $\boldsymbol{D}_k$ and $\boldsymbol{M}_k$ ($1 \le \boldsymbol{M}_k \le \boldsymbol{N}; 1 \le \boldsymbol{D}_k \le \boldsymbol{B}_{\boldsymbol{M}_k}$).

For each $1 \le k < \boldsymbol{L}$, day $\boldsymbol{D}_k$ month $\boldsymbol{M}_k$ falls before day $\boldsymbol{D}_{k+1}$ month $\boldsymbol{M}_{k+1}$.

Note: Only for this problem, all hidden testcases prepared by the jury are pretests. Therefore, all submissions with the feedback **PRETEST-PASSED** will receive the feedback **CORRECT** after the round ends.

Output

The first line contains the string "`YA`" (without the quotation marks) if there is a bridge day in this year, or "`TIDAK`" (without the quotation marks) if there is not a bridge day in this year.

You can print the string with any capitalisation. In other words, if there is a bridge day in this year, the output "`ya`", "`yA`", or "`Ya`" are also allowed.

Sample Input 1	Sample Output 1
3 7 31 28 31 1 1 3 1 28 1 29 1 30 1 1 2 30 3	YA

Sample Input 2	Sample Output 2
6 8 31 28 31 30 31 30 1 1 17 2 18 2 21 3 3 4 1 5 27 5 31 5	TIDAK

Explanation of samples

Sample input 1 matches the example in the description above.
