D Isomorphic Operations

Time limit: 2s

Description

Two strings X and Y of the same length are defined as *isomorphic* if for each pair of indices i and j, $X_i = X_j$ if and only if $Y_i = Y_j$. For example, string "aba" is isomorphic to string "bdb" and not isomorphic to string "abc".

Your friend has a string $\boldsymbol{S}$ of $\boldsymbol{N}$ characters, each is a letter 'a' to 'd'. Your friend also provides $\boldsymbol{Q}$ operations to be executed one by one. Each operation is one of the following types:

1. Given index $\boldsymbol{u}$ and character $\boldsymbol{c}$. Change character $\boldsymbol{S_u}$ to $\boldsymbol{c}$. Character $\boldsymbol{c}$ is a letter 'a' to 'd'.

2. Given two indices $\boldsymbol{l}$ and $\boldsymbol{r}$. For each index i $(l \le i \le r)$, change character $\boldsymbol{S_i}$ to the next character in the alphabet containing only letters 'a' to 'd'. Assume that the next character of 'd' is 'a'.

3. Given two indices $\boldsymbol{l}$ and $\boldsymbol{r}$, as well as an integer $\boldsymbol{p}$. Determine whether the substring of string $\boldsymbol{S}$ of length $\boldsymbol{p}$ beginning from index $\boldsymbol{l}$ is isomorphic to the substring of string $\boldsymbol{S}$ of length $\boldsymbol{p}$ beginning from index $\boldsymbol{r}$. In other words, determine whether $\boldsymbol{S_{l \ldots l+p-1}}$ is isomorphic to $\boldsymbol{S_{r \ldots r+p-1}}$.

Input

The first line contains two integers $\boldsymbol{N}$ and $\boldsymbol{Q}$ $(2 \le \boldsymbol{N} \le 100\,000; 1 \le \boldsymbol{Q} \le 100\,000)$ separated by a space. The second line contains string $\boldsymbol{S}$ of $\boldsymbol{N}$ characters, each is a letter 'a' to 'd'. The next $\boldsymbol{Q}$ lines each contain several integers or characters separated by spaces. The $k+2$-th line represents operation k beginning with the operation type and followed by one of the following formats:

- If operation k is an operation of type 1, then operation type is followed by $\boldsymbol{u}$ and $\boldsymbol{c}$ $(1 \le \boldsymbol{u} \le \boldsymbol{N}$; $\boldsymbol{c}$ is a letter 'a' to 'd').

- If operation k is an operation of type 2, then operation type is followed by $\boldsymbol{l}$ and $\boldsymbol{r}$ $(1 \le \boldsymbol{l} \le \boldsymbol{r} \le \boldsymbol{N})$.

- If operation k is an operation of type 3, then operation type is followed by $\boldsymbol{l}$, $\boldsymbol{r}$, and $\boldsymbol{p}$ $(1 \le \boldsymbol{l} < \boldsymbol{r} \le \boldsymbol{N}; 1 \le \boldsymbol{p}; \boldsymbol{r} + \boldsymbol{p} - 1 \le \boldsymbol{N})$.

At least one operation is of type 3.

Output

For each operation of type 3 in the same order, print "YA" (without the quotation marks) if $S_{l \ldots l+p-1}$ is isomorphic to $S_{r \ldots r+p-1}$, or "TIDAK" (without the quotation marks) if $S_{l \ldots l+p-1}$ is not isomorphic to $S_{r \ldots r+p-1}$.

You can print the string with any capitalisation. In other words, if $S_{l \ldots l+p-1}$ is isomorphic to $S_{r \ldots r+p-1}$, the output "ya", "yA", or "Ya" are also allowed.

Sample Input 1	Sample Output 1
8 7 ababcbdb 3 1 3 3 3 1 6 3 1 5 a 3 1 3 3 3 3 4 2 2 5 8 3 3 4 2	TIDAK YA YA YA TIDAK

Explanation of samples

The explanation for each operation is the following:

1. String "aba" is not isomorphic to string "abc".
2. String "aba" is isomorphic to string "bdb".
3. Change S_5 to 'a'. At the end of the operation, $S =$ "abababdb".
4. String "aba" is isomorphic to string "aba".
5. String "ab" is isomorphic to string "ba".
6. For each index i ($5 \leq i \leq 8$), change character S_i to the next character in the alphabet containing only letters 'a' to 'd'. At the end of the operation, $S =$ "ababbcac".
7. String "ab" is not isomorphic to string "bb".
